MEMO

TO: Distribution  
FROM: A. Klumpp  
DATE: 6 April 1970

During the Apollo 13 descent, there will be a new real-time plot for monitoring computer activity or time loss (TLOSS). This memo contains plots which show how the new real-time monitor plot should look for various values of TLOSS. These are plots of the time relative to PIPTIME of the radar velocity reading, versus time. The ordinate is calculated as word 5 minus word 7 of the descent telemetry, adding two if the difference is negative. The enclosed plots start just before acquisition of velocity data, and show the various events responsible for the anomalous behaviour of the plots. Also included herein are the corresponding plots of the VAC, CORESET, and WAITLIST activity.

*A. Klumpp*
