SUMMARY

This report documents the AS-205/CSM-101 Launch Vehicle Operational Trajectory, Revision 1, data. These data are presented from Guidance Reference Release (GRR) through S-IVB/IU lifetime. All detailed trajectory data are generated using an unbiased S-IB stage tilt program. The revision is necessary because of the decision to have an open loop propellant utilization system in the S-IVB stage.

The predicted S-IB and S-IVB stage end conditions are summarized below:

		<u>S-IB/S-IVB Separation</u>	<u>Guidance Cutoff Signal</u>
Flight Time	(sec)	144.49	614.63
Altitude	(km)	62.00	227.94
Space Fixed Velocity	(m/sec)	2325.8	7780.7
Space Fixed Path Angle	(deg)	63.420	90.007
Range	(km)	61.95	1819.97

The nominal weight at Guidance Cutoff Signal is predicted to be 67757 pounds. This is 1452 pounds in excess of the nominal propellant depletion weight.

The supporting tracking analysis will be published by R-AERO-FT. Summaries of the tracking coverage are presented in Figures 17 - 19.

Summaries of the $\pm 3\sigma$ trajectory flight envelopes at S-IB/S-IVB separation and S-IVB cutoff are presented in Tables 13 and 14. Detailed dispersion data will be presented in the "AS-205/CSM-101 Launch Vehicle Dispersion Analysis, Revision 1."

SECTION I. INTRODUCTION

The AS-205/CSM-101 Launch Vehicle Operational Trajectory, Revision 1, is presented in this document. Detailed trajectory data are presented from Guidance Reference Release (GRR) through S-IVB/IU lifetime.

Other pertinent data such as tracking and dispersion summaries are also included.

Acknowledgments are made to personnel of R-AERO-FT for providing the tracking data and to Mr. William R. Bailey for the dispersion summaries.

SECTION II. MISSION DESCRIPTION

A. Mission Objectives:

The basic purpose of the AS-205/CSM-101 mission is to launch and insert the manned Block II Apollo spacecraft into a near earth orbit to verify the spacecraft/crew operations and subsystems performance for an orbital mission.

The planned mission profile and support plans reflect the requirements for the following primary objectives: (1) Demonstrate CSM/crew performance in an earth orbital environment; (2) Demonstrate crew/space vehicle/mission support facilities performance during an earth orbital mission; (3) Demonstrate the adequacy of the launch vehicle attitude control system for orbital operation; (4) Demonstrate CSM active rendezvous with the S-IVB/IU/SLA; (5) Demonstrate S-IVB orbital safing capability; (6) Evaluate S-IVB J-2 engine ASI line modification.

The secondary test objectives are: (1) Evaluate the S-IVB/IU orbital coast lifetime capability; (2) Demonstrate CSM manual launch vehicle orbital attitude control.

B. Mission Groundrules and Constraints:

The following mission criteria and vehicle constraints have been included in shaping the S-IB stage profile and in establishing the S-IVB terminal conditions: (1) Launch from AFETR Pad 34; (2) Pad oriented launch azimuth of 100 degrees east of north; (3) Flight azimuth of 72 degrees east of north; (4) S-IB stage tilt program shaped for load relief during high dynamic pressure region; (5) Guidance command angle rate limit of 1 deg/sec in pitch and yaw; (6) S-IVB cutoff conditions for a 120/150 nautical mile elliptical orbit insertion.

SECTION III. VEHICLE CHARACTERISTICS AND ENVIRONMENT

A. Configuration:

The AS-205/CSM-101 Saturn IB Launch Vehicle consists of a S-IB stage, a S-IVB stage, an instrument unit, and a payload. The payload consists of the Launch Escape System (LES), Command Module (CM), Service Module (SM), and a Spacecraft Lunar Module Adapter (SLA). An outboard profile of the complete configuration is shown in Figure 20.

B. Mass:

The AS-205 vehicle mass characteristics used to generate the operational trajectory are defined in Reference 1. Table 12 presents a vehicle weight breakdown of the launch vehicle and payload.

C. Propulsion:

The S-IB stage is powered by eight H-1 engines which have a nominally rated sea level thrust of 200,000 pounds each. The predicted thrust history for each H-1 engine including thrust decay and the associated turbine engine thrust were obtained from Reference 2.

The S-IVB stage is powered by a single J-2 engine which has a rated vacuum thrust of 200,000 pounds at a nominal mixture ratio of 5:1. The S-IVB stage has an open loop propellant utilization system which is set for a mixture ratio of 5.5 to 1 and a corresponding thrust for approximately 300 seconds. The mixture ratio then shifts to 4.5 to 1 for the remainder of the S-IVB stage. The predicted J-2 engine thrust history from 90% thrust to Guidance Cutoff Signal (GCS) was obtained from Reference 2. The thrust buildup and decay histories were obtained from References 4 and 5.

The S-IB stage is decelerated at separation by four solid propellant retro-motors (TE-M-29) mounted on the S-IB/S-IVB interstage. These motors nominally provide 36,720 pounds of thrust each (Reference 6).

There are three solid propellant ullage motors mounted on the S-IVB aft portion to provide the necessary positive acceleration to settle the S-IVB stage propellants for J-2 engine start. These motors are rated at 3460 pounds of thrust each (Reference 7).

The S-IVB Stage Auxiliary Propulsion System (APS) provides roll control during J-2 burn and pitch, yaw, and roll control during the orbital portion. The APS consists of two modules, each containing three 150 pound thrust (vacuum) hypergolic rocket engines.

D. Aerodynamics:

Aerodynamic data for the S-IB and S-IVB stages of powered flight were obtained from Reference 8. Reference 9 presents the orbital drag data.

E. Environment Description:

The 1963 Patrick Reference Atmosphere Model defines the atmospheric properties incorporated in the trajectory simulation. The earth model and potential function are those of the Fischer Earth Model. Since the planned launch date is for a "low wind period," the S-IB stage tilt program is not wind biased. However, the median wind for the month of October was included in the trajectory. The wind profile was derived from Reference 10 and presented graphically in Figure 16.

SECTION IV. GUIDANCE AND CONTROL

The Saturn IB inertial guidance system performs navigation evaluations, issues discrete commands, initiates certain guidance and control functions, and issues steering commands to guide the launch vehicle to the pre-specified terminal conditions.

A. Guidance:

The AS-205/CSM-101 Launch Vehicle guidance is divided into three phases: (1) Pre-IGM; (2) IGM; (3) Orbital.

The Pre-IGM phase provides guidance commands in pitch, yaw, and roll from lift-off to the time of IGM initiation. The S-IB pitch program polynomials and the yaw and roll command histories are presented in Appendix B.

The S-IVB stage is steered to the desired terminal conditions by the Iterative Guidance Mode (IGM). The IGM equations and logic which provide guidance in pitch and yaw are initiated at TB3 + 25 seconds. The IGM constants are presented in Table 3B.

The orbital guidance mode provides pitch, yaw, and roll attitude commands during the orbital phase. The orbital maneuvers are presented in Table 2A.

B. Control:

The S-IB stage is controlled in pitch, yaw, and roll by four swivelable H-1 engines. The S-IB stage control law, gains, and network characteristics are given in Reference 11.

The J-2 engine provides pitch and yaw attitude control throughout S-IVB powered flight. The Auxiliary Propulsion System provides the roll control. The S-IVB control data are presented in Reference 11.

SECTION V. TRAJECTORY DESCRIPTION

A. Powered Flight:

All of the detailed trajectory information is based on an unbiased S-IB tilt program. Table 1 presents the nominal sequence of events for the AS-205/CSM-101 Launch Vehicle Operational Trajectory. Table 2 presents a summary of trajectory parameters at pertinent events from GRR to loss of S-IVB/IU attitude control. Tables 3 and 4 present convenient summaries of the S-IB and S-IVB stage end conditions. Detailed tabular listings are contained in Tables 5 - 9 and Appendix C. Graphical displays of various trajectory parameters are presented in Figures 1 - 15.

The S-IB launch phase begins at Guidance Reference Release, which is assumed to be 5 seconds prior to first motion, and ends at S-IB/S-IVB physical separation. Separation occurs at 144.49 seconds after first motion.

During the S-IB powered flight phase, a constant thrust bias of .4 per cent of the vehicle sea level longitudinal thrust is included. This is an attempt to minimize the effects of an apparent systematic shift in the ground to flight test performance level.

The S-IVB stage J-2 engine start command is issued 2.7 seconds after the S-IB stage outboard engines cut off. Approximately 25 seconds after outboard engine cutoff, the Iterative Guidance Mode is initiated and steers the S-IVB stage to the desired terminal conditions. These terminal conditions are nominally reached approximately 614.6 seconds after first motion.

B. Orbital Phase:

The orbital phase begins ten seconds after Guidance Cutoff Signal (GCS) and continues through the guaranteed S-IVB/IU lifetime. During the orbital

phase the S-IVB stage is required to perform certain attitude maneuvers. This is accomplished by the APS. Detailed information concerning the orbital maneuvers is presented in Appendix A. The orbital trajectory is listed in Table 8.

C. Spent Stage:

This portion of flight is initiated when the four retro-rockets are ignited at S-IB/S-IVB separation. The S-IB spent stage re-entry trajectory is presented in Table 9.

SECTION VI. LAUNCH VEHICLE PERFORMANCE SUMMARY

The predicted S-IB and S-IVB stage performance characteristics presented in Table 11. These data are time averages of the detailed vehicle performance data presented in Reference 2. These data are to be used in post-flight trajectory analysis.

SECTION VII. TRACKING SUMMARY

The tracking and telemetry station coordinates are presented in Table 10. A summary of the launch and orbital timeline is presented in Figure 19. The associated orbital ground projection is given in Figure 17.

SECTION VIII. DISPERSION SUMMARY

Tables 13 and 14 present the $\pm 3\sigma$ dispersions for certain trajectory parameters at S-IB/S-IVB separation and S-IVB cutoff, respectively. These data are extracts from the data to be presented in the "AS-205/CSM-101 Launch Vehicle Dispersion Analysis, Revision 1."
