Tran, To-Tu	281-335-2263
Arnold, C.A.	281-335-2217
Penney, Michael	281-335-2226

### **Purpose:**

The STS-116 flight depending on launch date could be on-orbit when the calendar year transitions from 2006 to 2007 which will result in a problem for the General Purpose Computers (GPCs). That is the first day of the New Year the GPCs will transition from day 365 to day 366 while the Master Timing Unit (MTU) will transition from 365 to 001. A problem would then result when the GPCs request an update from the MTU the delta time would cause an exception to the GPC. The solution is to bring down the GPCs and perform Initial Program Load (IPL) to re-initialize the GPCs. The purpose of this analysis is to document the delta risk of performing this procedure. This paper will analyze two potential hazards. 1) Failure to perform the procedure would result loss of all GPCs and an inability to undock from the ISS. 2) Failures that require an emergency undock while the vehicle is unable to respond could result in Loss of Crew and Vehicle.

### **Methodology:**

A fault tree methodology was chosen for this analysis. Three fault trees were developed (shown in Appendix A). The first fault tree is used to quantify the probability of failure to perform the IPL procedure. It was developed with three branches (1) Orbiter hardware, (2) Ground support and satellite tracking, and (3) human factors. A second fault tree is used to calculate the probability of Loss of Mission due to Failed Redundant Hardware Strings. A third fault tree is used to quantify the probability of having to perform an emergency undock. The top logic of this fault tree is shown in Appendix A. The fault tree logic that supports the top logic is documented in the SPRA Iteration 2.1.

### **Assumptions:**

Failure to Perform the IPL

- 1) Assumed flight rule will be implemented stating if there are failures of hardware critical to performing the IPL the mission will be terminated, to avoid the YERO event. Therefore the exposure window for this analysis limited to the duration of the YERO recovery procedure (4 hours) considered a conservative estimate of the time required to perform the IPL
- 2) Only the delta mission risk is evaluated that is the risk of performing the IPL in space.
- 3) For this iteration it is assumed ground support and Tracking & Data Relay Satellite System (TDRSS) is available.
- 4) Assumed the IPL procedure has been adequately verified and will work.
- 5) Assumed ground operations will be performed nominally.
- 6) Assume Ku-band is backed up by S-band on-orbit
- 7) Assume S-band Switch Beam Control Assembly (SBCA) and Switch assembly are not critical to S-band operation
- 8) Assume S-band preamp and power amp are internally redundant
- 9) Although there is an HRA event “Crew Fails to Perform Procedure” this event is set false because the crew can perform multiple attempts.
- 10) Although the IPL can be performed without the MTU its failure contribution was consider for the analysis. This is because it is assumed the IPL will be developed assuming a functional MTU. That is if the MTU is failed a contingency Load will need to be developed.
- 11) ADD Software assumption here.

### **Probability of an Emergency Undock**

- 1) SPRA Iteration 2.1 was used with the exposure time adjusted from a 9 day mission to 1 and 12 hours.
- 2) The vehicle will be unable to respond for ~45 minutes during the IPL. This was rounded to 1 hour.
- 3) A 12 hour case was included in case the procedure took longer to perform than anticipated.

- 4) The following flight rules were evaluated that would require an emergency undock:
- Loss of Cabin Pressure
  - Loss of Two Cabin Fans
  - Loss of Two Freon Loops
  - Loss of Two Water Loops
  - Loss of PPO2 Control
- 5) Loss of Both A/G voice and CMD and OMS/RCS propellant leaks was considered to be insignificant compared to other contributors.
- 6) Fire in AV Bay or Cabin was not considered
- 7) Impending Loss of ALL APU/HYD was not considered because it is quiescent during the time frame of concern and failure while quiescent is considered to be insignificant compared to other contributors.
- 8) This procedure will not be performed during any critical mission activities.

### **Reliability Data:**

Reliability data was obtained from S&MA Reliability Reports and Shuttle Quick Look (developed from shuttle data) and is presented in Appendix B. Basic events and their associated data for each of the scenarios are listed in Appendix C.

### **Results:**

Table 1 – IPL PRA Results

	Probability	Probability (1 in X)	Comment
Failure to Perform IPL	8.70E-05	11,500	Cut sets provided in Appendix D
Probability of having to perform an Emergency undock during a 1 hour period	1.85E-05	54,000	Cut sets provided in Appendix D
Probability of Loss of Mission (LOM) due to loss of redundant string(s)	1.00E-01	10	Cut sets provided in Appendix D

If these events were conservatively considered to be Loss of Crew then performing this procedure would increase the probability of Loss of Crew by less than 1 percent based on STS-115 probability of Loss of Crew of 1:77.

Failure to perform the IPL is heavily dependent on both crew and mission operations actions. However, since it is assumed that the procedure can be restarted as many times as necessary if until success human error does not end up as a risk driver.

### Sensitivity Study

Two sensitivity studies were also run one to document the case where a flight rule is not evoked requiring mission termination upon losing 1 string of 2 string redundant hardware or losing 2 strings of a 3 string redundant hardware system. The exposure time is assumed to 24 hours. That is 12 hours prior the new year and up to 12 hours to implement the procedure post new years.

The second entry presents the probability of an anomaly occurring that would require an emergency undock during a 12 hours window. This would be a case where the IPL did not go as planned and therefore took an extended period of time.

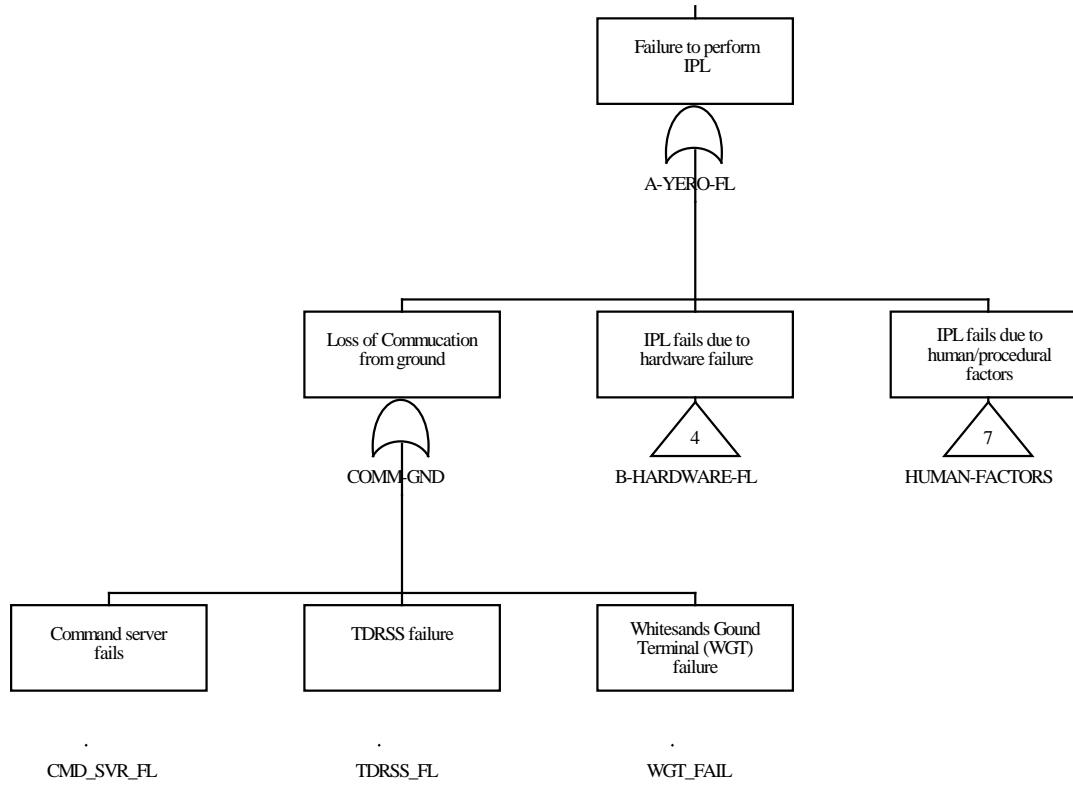

Table 2 – IPL PRA Sensitivity Study Results

	Probability	Probability (1 in X)	Comment
No Flight Rule Case (24 hours exposure time)	4.20E-04	2,380	Cut sets provided in Appendix D
Probability of having to perform an emergency undock during a 12 hour period	1.85E-04	5,400	Cut sets provided in Appendix D

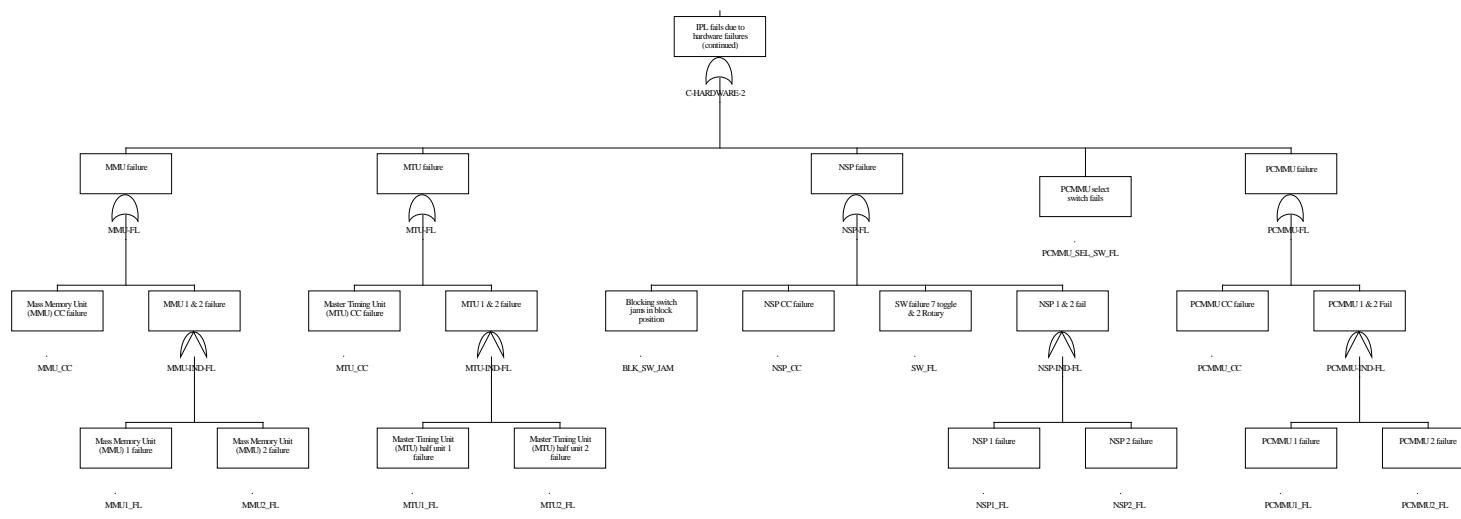

## Appendix A: Failure to Perform IPL Fault Tree

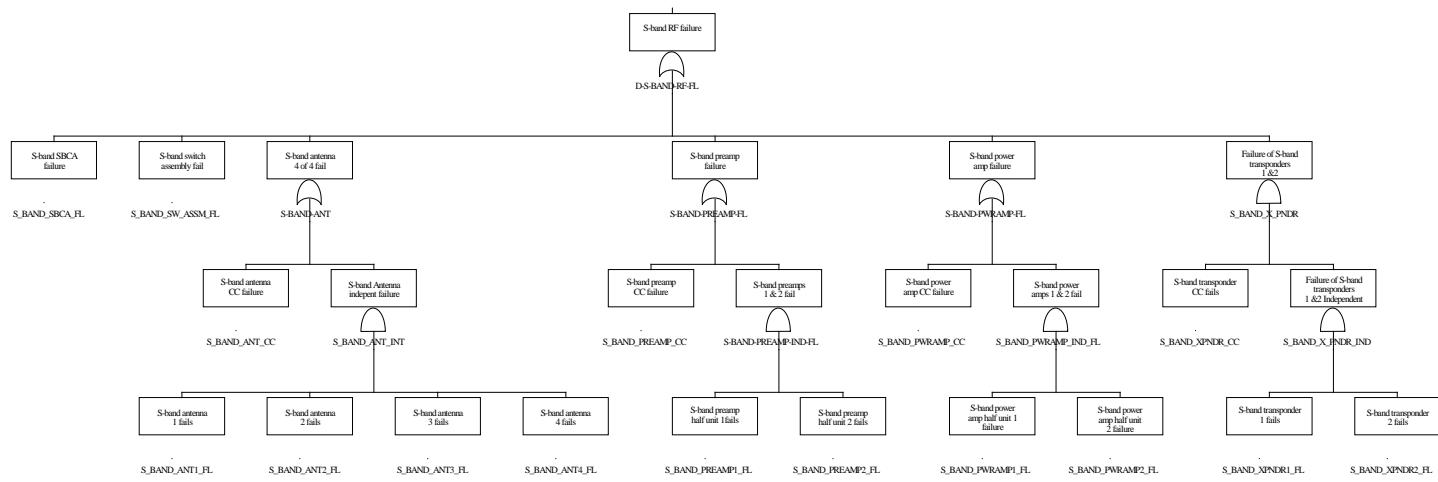

Tree Title	Page Number
Failure to Perform IPL	A-3
Loss of Mission due to Failed Redundant Hardware String	A-9
Probability of Required Undock Procedure	A-15

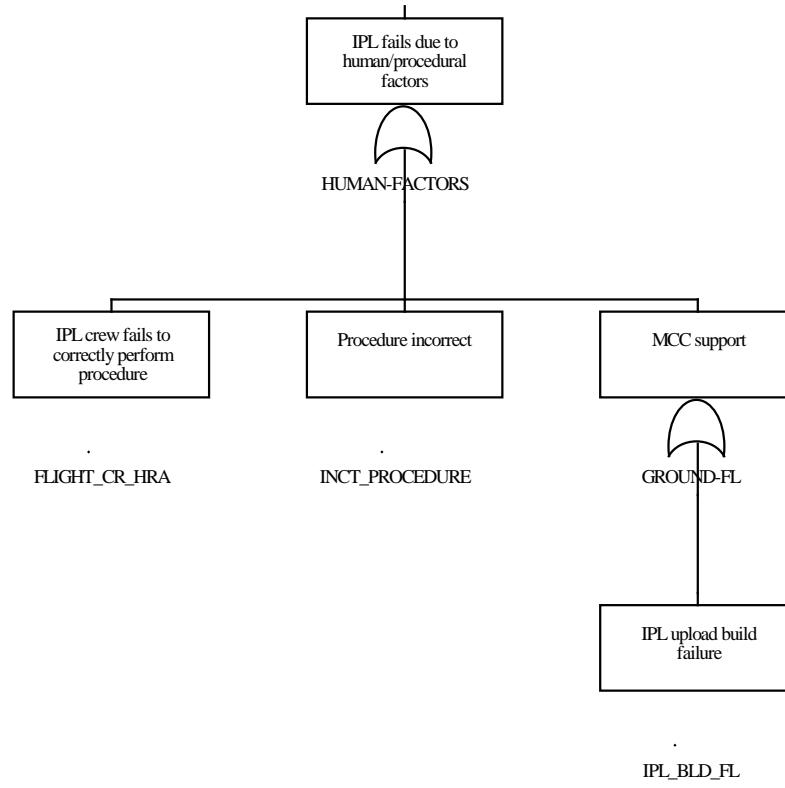

Fault Tree - Failure to Perform IPL

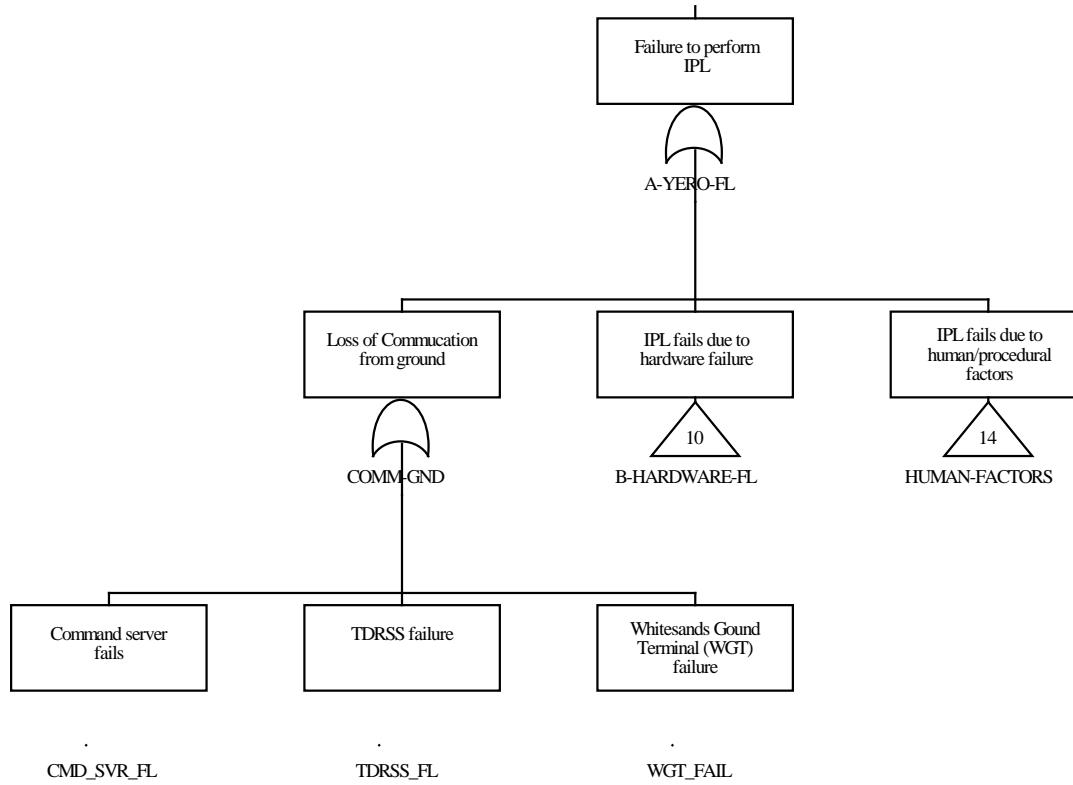

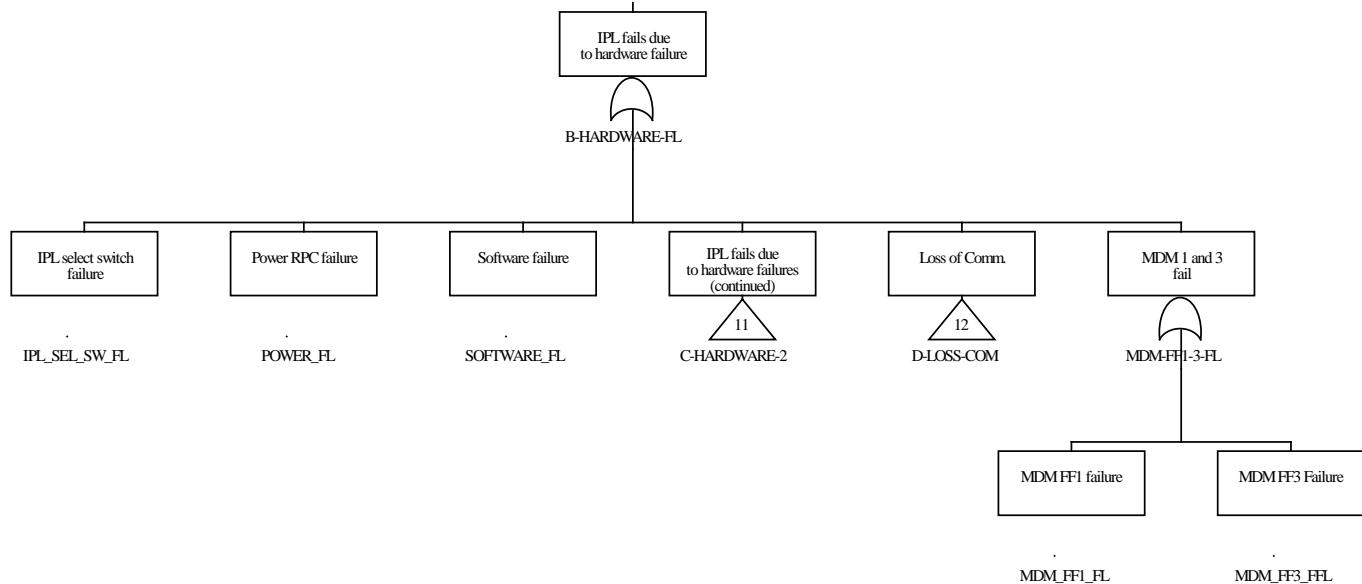

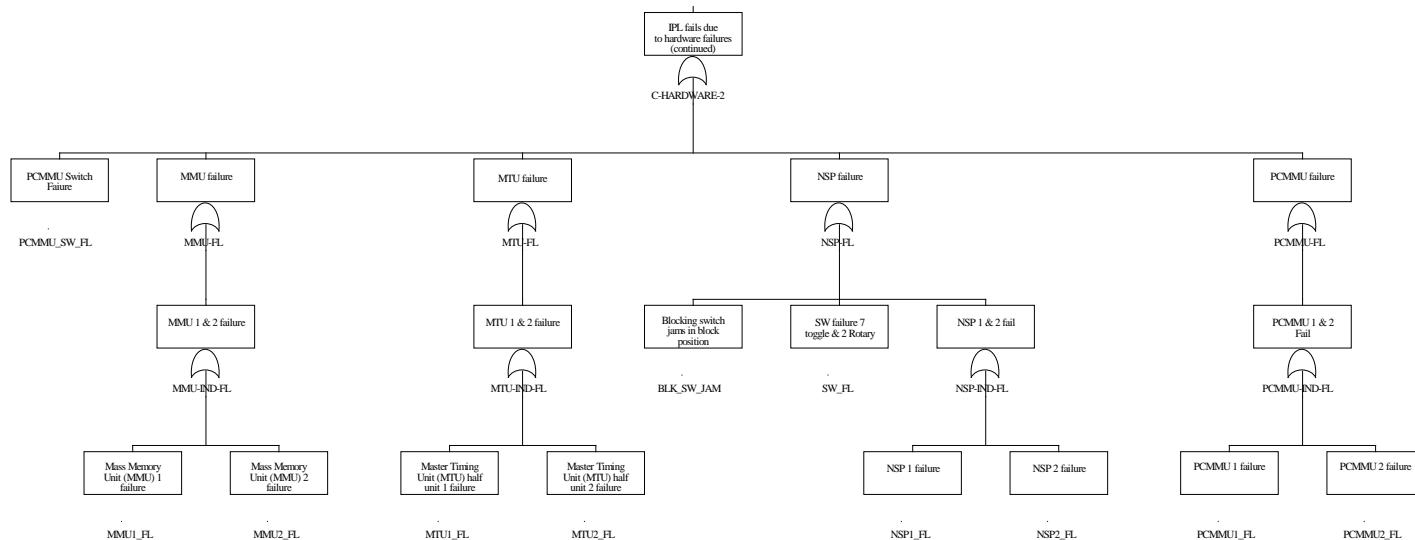

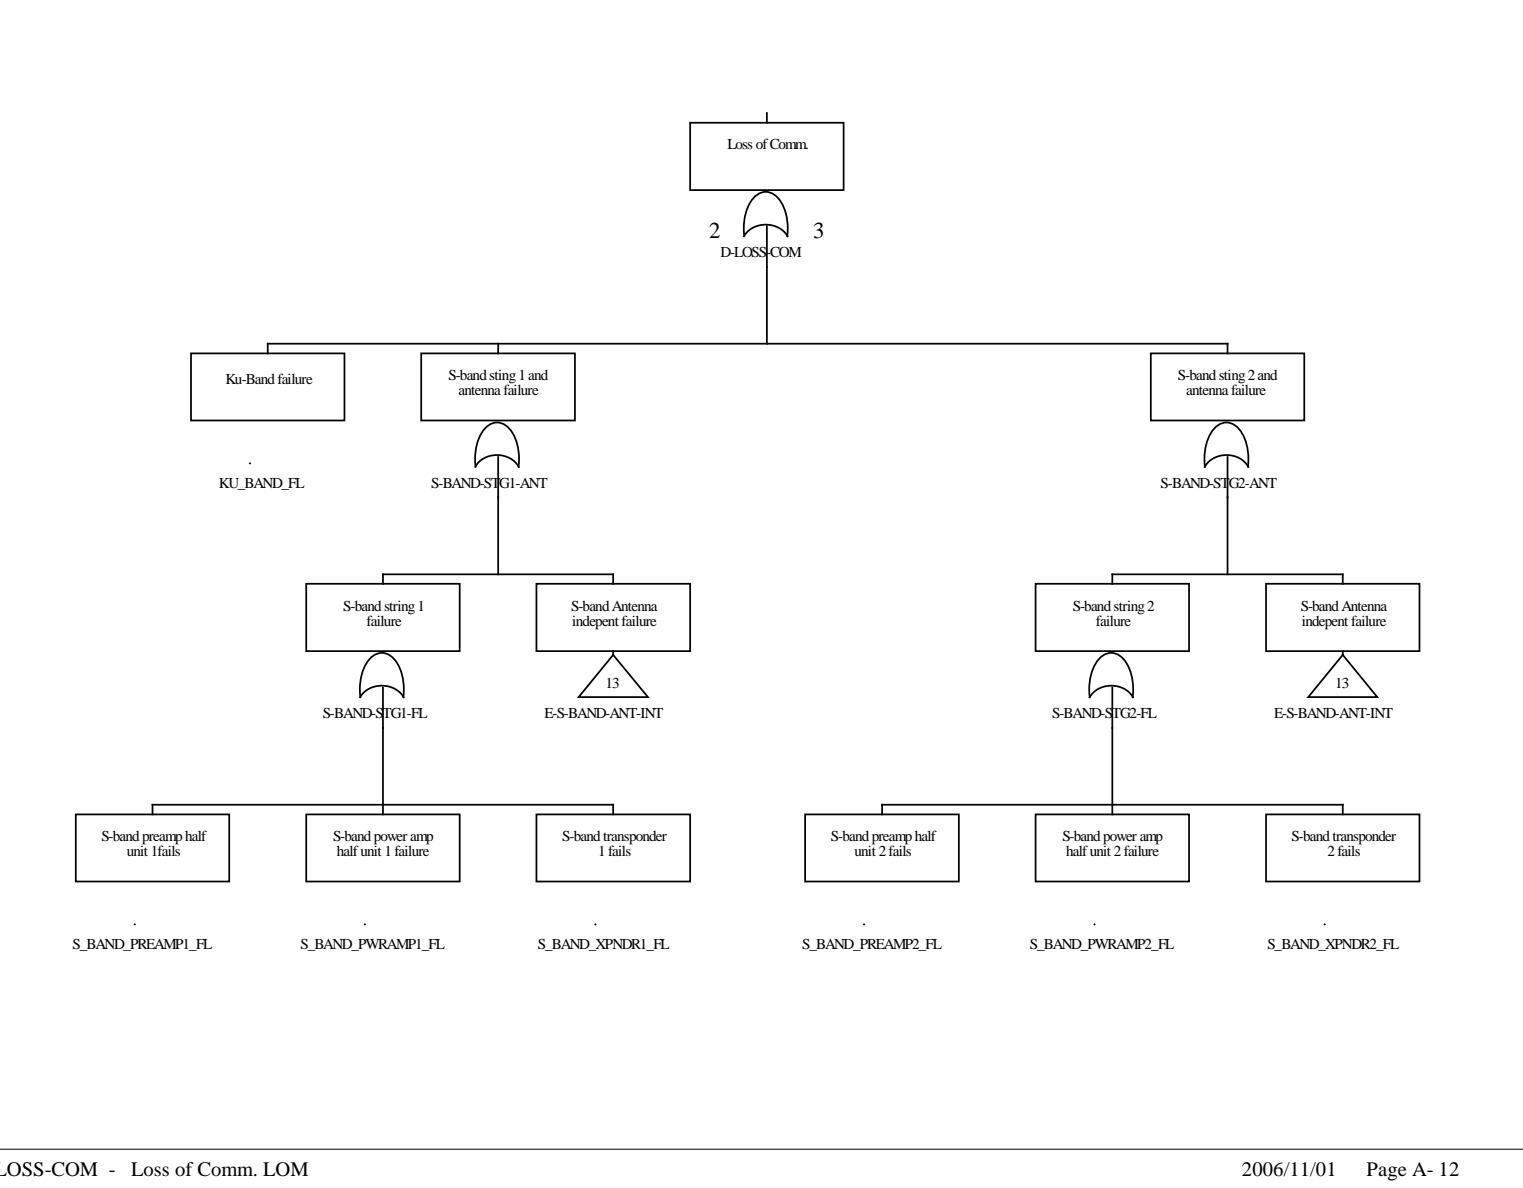

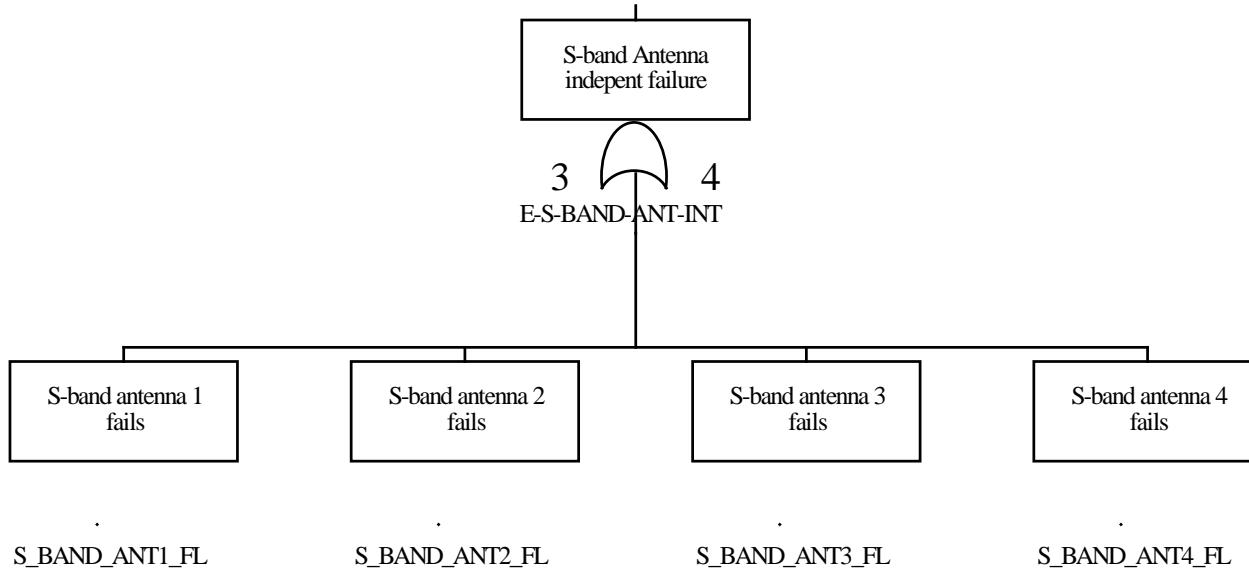

Fault Tree - Loss of Mission due to Failed Redundant Hardware String
